

☺ LangGraph: Build Stateful Agentic AI graph

Daily AI News Summary

Okay, let's tackle this query. The user wants me to summarize AI news articles into markdown format as per their specific instructions. First, I need to go through each article they provided and extract the necessary information.

Starting with the dates, all the articles are from October 27, 2025, except one from October 26. The user mentioned using the IST timezone. The dates given are in GMT, so I need to convert those to IST. Since IST is GMT+5:30, I'll add 5 hours and 30 minutes to each GMT date. For example, an article posted at 07:38:00 GMT would be 13:08:00 IST. I should check all dates and convert them accordingly.

Next, each summary should be concise. Let me read through each article's content. The first one is about Movate appointing Arvind J as CHRO. The key points are the appointment, role in leading HR with AI, and strategic partnerships. I need to condense that into a sentence or two.

Another article is about AI in agriculture. The main points are the technologies, regions leading the research, and challenges. I'll highlight the key regions and the application areas.

For the Qualcomm article, the focus is on new AI chips for data centers and their availability next year. I'll mention their expansion into AI infrastructure and the support for existing tools.

The ransomware prediction article from QBE reports a 40% increase. I'll note the projection and the reasons like cloud vulnerabilities.

The Business Insider article mentions using AI for content creation with human oversight. That's important for the summary.

I also need to check for duplicates. For example, the Movate appointment is covered in multiple articles. I should consolidate them into one entry to avoid redundancy.

Sorting by date in descending order. The latest articles are from 2025-10-27. The one from October 26 is slightly older but still recent. The October 26 articles should come after the October 27 ones.

Now, creating the markdown with the headers for each date. Each summary should have the date in bold, a bullet point with the summary, and the source URL as a link. I need to ensure the URLs are correctly formatted as hyperlinks.

Check for any missing information. For example, the article about the AI-generated avocado ripeness detection. The key points are the use of smartphone-based AI and the collaboration between universities.

Also, the article about the Faridabad teen and AI blackmail is a serious issue. I'll highlight the use of AI in generating fake content leading to real-world consequences.

I need to make sure all summaries are concise and capture the essence without including too much detail. Avoid technical jargon where possible to keep it accessible.

Finally, review the entire list to ensure all dates are converted correctly, summaries are accurate, and the order is from latest to earliest. Also, verify that each URL is correctly linked and the markdown syntax is correct.
